Project Delivery & People Operations Portal

Executive Summary: A single internal portal for VAPT project delivery, daily engineering updates, client delay tracking, and HR governance. Senior management gets real-time visibility into active engagements, resource utilization, blockers, and attendance—without manual status calls or scattered spreadsheets.

1. GOVERNANCE & ROLE SEPARATION

Role	Primary Responsibility in the Portal	Control & Confidentiality Boundary
Senior Management (Admin)	Portfolio oversight, project creation, team allocation, project hold/closure approvals, final leave sign-off, and firm-wide delivery metrics.	Full visibility across projects, updates, blockers, and workforce metrics. Employee registration stays strictly with HR.
HR Operations	Employee onboarding (`CSS###` codes) in Supabase, role assignment, lifecycle tracking, shift roster, IT assets, payslips, leave records, and HR tickets.	Sole authority to create or close employee accounts; only HR-created `@cybersmithsecure.com` accounts can enter via Microsoft SSO (`authvr5`).
Team Leaders (TL)	Day-to-day project execution, scope & requirement updates, client discussions, first-level leave review, and unblocking assigned engineers.	Manages assigned engagements and team updates; structural project status changes (Hold / Closure) require Admin approval.
Project Engineers	Morning plan & evening work updates, hours logged, raising blockers, project queries, and self-service leave / attendance requests.	Sees only their own work, assigned projects, and personal hours. Cannot view other engineers' performance, hours, or HR/Admin profiles.

2. SIMPLE FEATURE LIST

A. Portfolio & Project Delivery

- **Live Project Register:** Active, On-Hold, Draft, and Closed engagements with client name, start date, initial report date, and closure date.
- **Scope & Access Vault:** Central record of target URLs, IPs, config files, VPN profiles/credentials, test credentials, and SharePoint links.
- **Requirement Tracking:** Each requirement tracked as *Fulfilled*, *Pending from Client*, *Pending from Us*, or *Incomplete*.
- **Client Discussion Log:** Dated record of client calls, participants, summary, and agreed outcomes.

B. Daily Execution & Attendance

- **Two-Slot Daily Tracker:** Structured Morning plan and Evening completion log (cut-off 7:30 PM) with hours spent and itemized work points.
- **Automatic Attendance Marking:** A working day is counted automatically when both morning and evening updates are logged on time.
- **Exception Requests:** Guided requests for late-morning entries, missed update regularization, and worked-day credit with audit trails.
- **Updates Calendar:** Monthly view of who reported, who missed a slot, and total hours logged per project.

C. Escalations, Blockers & Queries

- **Severity-Tagged Blockers:** Engineers and TLs log Low, Medium, High, or Critical blockers; status tracked from *Open* to *In-Review* to *Resolved*.
- **Client vs. Internal Hold Tracking:** Clearly distinguishes engagements paused due to client readiness vs. internal bandwidth.
- **Project Query Sessions:** Threaded, project-linked Q&A with file/screenshot attachments so technical clarifications stay on the project record.
- **Instant Notifications:** In-app alerts and optional Slack / Microsoft Teams webhook broadcasts for critical events.

D. People Operations & Access Security

- **Microsoft SSO Only (`authvr5`):** Exclusive company login via `@cybersmithsecure.com` matched against HR-created Supabase records and roles.
- **New vs. Returning User Flow:** New HR-created accounts must set their password once on first sign-in before entering the workspace; existing users go straight to their daily dashboard.
- **Lifecycle & IT Assets:** Tracks onboarding, confirmation, laptops, ID cards, VPN access, and tool permissions with instant revocation on exit.
- **Employee Self-Service:** Leave balances (Casual / Sick), payslip downloads, profile photo upload, and HR helpdesk tickets.

Workflows & What We Achieve

3. CORE OPERATIONAL WORKFLOWS

Workflow 1: HR Account Creation & Microsoft SSO (`authvr5`) Sign-In

HR creates the employee account in Supabase (`CSS###` , `@cybersmithsecure.com` email, role, city, manager) → **Employee** signs in using *Sign in with Microsoft (authvr5)* → **If New Account:** User is prompted to set their password once and is then taken automatically to the daily workspace → **If Existing User:** Lands directly on the Dashboard to start daily work.

Workflow 2: Project Kickoff to Closure Governance

Admin creates the project, sets dates, uploads scope/VPN/SharePoint details, and assigns a **Team Leader** & engineers → **Team** executes testing and logs client discussions → If scope changes or a project must be paused/closed, **TL** submits a Requirement or Hold/Closure request (marking Client vs. Internal reason) → **Admin** reviews and approves before the portfolio status changes.

Workflow 3: Daily Work Reporting & Attendance Discipline

Engineer / TL submits the *Morning Update* (planned tasks for the day) → Completes the *Evening Update* before 7:30 PM with hours spent and work points delivered → **System** automatically marks the day as worked and rolls hours into project analytics → Missed or late slots require a formal **Worked-Day / Regularization Request** approved by leadership.

Workflow 4: Blocker & Technical Query Escalation

Engineer hits an environment issue, missing credential, or critical finding and logs a *Blocker* or *Query Session* → **TL & Admin** receive an immediate notification → **TL** resolves technical queries or escalates client-side blockers during client discussions → Blocker is marked *Resolved* with a permanent audit trail on the project.

Workflow 5: Two-Stage Leave & Capacity Approval

Employee submits a leave request against available Casual/Sick balance → **Team Leader** reviews impact on active project deadlines (`Pending TL`) → **Admin / HR** grants final approval (`Approved`) and leave balance updates automatically.

Workflow 6: Controlled Offboarding & Asset Recovery

HR moves employee to *Offboarding* and sets last working date → Offboarding checklist tracks laptop return, ID card recovery, and tool/VPN revocation → On exit, **Portal** blocks Microsoft SSO login immediately while preserving historical project logs and HR records.

4. WHAT SENIOR MANAGEMENT ACHIEVES THROUGH THIS APP

1. Real-Time Portfolio Visibility
See every Active, On-Hold, and Closing engagement in one place—and immediately know whether a delay is caused by the client or internal capacity.

2. Accountable Daily Utilization
Every logged hour and daily deliverable is tied to a specific project and engineer, connecting daily work directly to attendance.

3. Faster Escalation & Unblocking
Critical blockers and pending client requirements surface on the dashboard immediately instead of slipping until report delivery dates.

4. Strict Governance & Approvals
Scope changes, project holds, project closures, leaves, and attendance exceptions require formal approval with a clear decision trail.

5. Centralized SSO & Role Control
All staff sign in exclusively through company Microsoft SSO (`authvr5`) with the exact role assigned by HR in Supabase; exited staff lose access instantly.

6. Engineer Privacy & Audit Readiness
Engineers stay focused on their own assigned work without seeing peer hours or performance, while leadership maintains a complete, audit-ready record.
